

AMENDMENTS TO THE CLAIMS

Below is the entire set of pending claims pursuant to 37 C.F.R. 1.121(c)(3)(i), with any mark-ups showing the changes made by the present Amendment.

1-25. (Canceled)

26. (New) A method of communicating a message in a computer network, the method comprising:

receiving the message from a sender application, the sender application associated with a first messaging paradigm;

processing the message according to the first messaging paradigm; and

processing the message according to a second messaging paradigm.

27. (New) The method of claim 26, wherein the processing the message according to the first messaging paradigm comprises routing the message to at least one original destination, and the processing the message according to the second messaging paradigm comprises routing the message to at least one bridged destination associated with the at least one original destination.

28. (New) The method of claim 27, wherein a software bridge associates a first of the at least one original destinations with a first of the at least one bridged destinations.

29. (New) The method of claim 28, wherein the at least one original destination comprises a plurality of original destinations, and the software bridge associates the plurality of original destinations with the first bridged destination.

30. (New) The method of claim 28, wherein the at least one bridged destination comprises a plurality of bridged destinations, and wherein the software bridge associates the first original destination with the plurality of bridged destinations.

31. (New) The method of claim 28, wherein a plurality of messages are routed to the first original destination, and the software bridge selects the message from the plurality of messages.

32. (New) The method of claim 31, wherein the processing the message according to the second messaging paradigm further comprises determining that the first bridged destination is permitted to receive the message.

33. (New) The method of claim 28, wherein a configuration file comprises the software bridge.

34. (New) The method of claim 28, wherein an administrator console comprises the software bridge.

35. (New) The method of claim 26, wherein the first messaging paradigm and the second messaging paradigm utilize Java messaging.

36. (New) A tangible, machine-readable medium embodying a sequence of instructions that, when executed by a machine, causes the machine to perform operations comprising:

receiving a message from a sender application, the sender application associated with a first messaging paradigm;

processing the message according to the first messaging paradigm; and

processing the message according to a second messaging paradigm.

37. (New) The tangible, machine-readable medium of claim 36, wherein the first messaging paradigm comprises a topic-based publish-subscribe messaging paradigm, the sender application comprises a publishing application, the message is associated with a topic, and the processing the message according to the first messaging paradigm comprises routing the message to a publish module.

38. (New) The tangible, machine-readable medium of claim 37, wherein the processing the message according to the first messaging paradigm further comprises delivering the message to a number of subscriber applications that are registered to receive messages associated with the topic.

39. (New) The tangible, machine-readable medium of claim 38, wherein the number of subscriber applications is zero.

40. (New) The tangible, machine-readable medium of claim 37, wherein the second messaging paradigm comprises a queuing messaging paradigm.

41. (New) The tangible, machine-readable medium of claim 36, wherein the first messaging paradigm comprises a queuing messaging paradigm and the processing the message according to the first messaging paradigm comprises routing the message to a queue module.

42. (New) The tangible, machine-readable medium of claim 41, wherein the processing the message according to the first messaging paradigm further comprises delivering the message to a queue consumer.

43. (New) The tangible, machine-readable medium of claim 41, wherein the second messaging paradigm is a topic-based publish-subscribe messaging paradigm.

44. (New) The tangible, machine-readable medium of claim 36, wherein the processing the message according to the first messaging paradigm comprises routing the message to at least one original destination, and the processing the message according to the second messaging paradigm comprises routing the message to at least one bridged destination associated

with the at least one original destination.

45. (New) The tangible, machine-readable medium of claim 44, wherein the processing the message according to the first messaging paradigm further comprises determining whether the at least one original destination is configured to receive the message, and the processing the message according to the second messaging paradigm further comprises determining whether the at least one bridged destination is configured to receive the message.

46. (New) The tangible, machine-readable medium of claim 45, the operations further comprising:

aborting delivery of the message unless the at least one original destination and the at least one bridged destination are configured to receive the message.

47. (New) A system to communicate a message in a computer network, the system including a server configured perform operations comprising:

receiving the message from a sender application, the sender application associated with a first messaging paradigm;

processing the message according to the first messaging paradigm; and

processing the message according to a second messaging paradigm.

48. (New) The system of claim 47, wherein the processing the message according to the first messaging paradigm comprises routing the message to an original destination, and the

processing the message according to the second messaging paradigm comprises routing the message to a bridged destination associated with the original destination.

49. (New) The system of claim 48, wherein a software bridge associates the original destination with the bridged destination.

50. (New) The system of claim 49, wherein the first messaging paradigm comprises a topic-based publish-subscribe messaging paradigm, and the second messaging paradigm comprises a queuing messaging paradigm.
